Summary

Front end engineer with 4 years of experience building React and TypeScript products. Strongest in web performance, design systems, and build tooling for monorepos and micro-frontends.

Skills

Languages: HTML, CSS, JavaScript (ES6+), TypeScript

Technologies: React, Next.js, Redux, TanStack Query, GraphQL (Apollo), Tailwind CSS, Storybook, Jest, React Testing Library, Playwright, Webpack (Module Federation), Nx, pnpm

Back end: Node.js, NestJS, PostgreSQL, REST APIs

Experience

Senior Product Engineer (Front End), Premagic — Apr 2026 - Present

- Cut the account app's up-front JavaScript from 13.5 MB to 5.8 MB, improving load time, by code-splitting 23 routes with React.lazy and Suspense and moving Konva into a lazy chunk
- Extended the embeddable poster-widget SDK: a command API that queues calls until React mounts, cross-origin LinkedIn OAuth via a hidden iframe, and sign-in that survives iOS reloads
- Upgraded a 7-app Nx monorepo from React 18 to 19, Nx 22 to 23 and Storybook 9 to 10 in stacked codemod PRs with a rollback plan; 828 tests and 7 production builds stayed green, no reverts
- Split the serial GitHub Actions CI job into parallel Nx affected build, lint and test jobs with a remote cache, and scoped type-aware ESLint per project, cutting a full lint from ~16 min to under 8
- Built the Node.js and Playwright service that renders each attendee's poster image or print PDF, keeping a warm Chromium page per event in an LRU pool to re-render in 85-130 ms, not ~20 s
- Added two-factor login (TOTP with QR enrollment) and Google single sign-on to the organizer app on AWS Cognito, after migrating its auth layer from Amplify v4 to v6
- Grew the Cypress end-to-end suite from 2 to 12 features (22 scenarios) and pointed it at the deployed app, with a post-deploy release smoke and a weekday nightly run against production
- Extended the organizer CSV import wizard from attendees to sessions and exhibitors with header auto-mapping, a people-type value-mapping step and a validator covered by 36 Jest tests

Software Engineer, KeyValue Software Systems — Jul 2022 - Mar 2026

- Owned front-end delivery for 7 products across 8 Southeast Asian markets (clinic management, payments, AI onboarding) serving 75,000+ active users, built with React and TypeScript
- Reduced LCP from 4.2s to 2.5s (~40% faster load) through route-level code splitting, lazy loading, and consolidating redundant GraphQL and REST calls
- Built the shared React/TypeScript component library that cut feature delivery ~30%, and designed a Webpack Module Federation micro-frontend architecture so teams shipped independently
- Cut production regressions 35% by introducing a Jest and React Testing Library gate on merge

Projects

react-native-fps-counter — npmjs.com/package/@vyshnav18/react-native-fps-counter

- Created and maintain an open-source React Native FPS counter library, published on npm

Education

Cochin University of Science and Technology — 2018 - 2022

B.Tech in Computer Science and Engineering
